

Technical Exercise — Quote Verification

AI Engineer / Forward-Deployed Engineer candidate assessment

This exercise is intentionally open-ended. We are more interested in how you think about the problem and what you build than in matching a specification. There is no expected answer and no required approach — show us the path you would actually take.

The business challenge

Dynamix is a \$300M IT value-added reseller. Every deal we sell is priced independently, transaction by transaction, and most of what we sell is sourced from a distributor. We can't rely on a prior deal's pricing or an expired quote — each opportunity needs fresh, valid supplier pricing.

When our sales team decides to quote an opportunity, our sales-assistance team requests current supplier quotes from distribution and builds the deal in our quoting tool: applying our margin, reviewing the SKUs and terms, and formatting it to our template. The supplier quotes are saved with the deal for reference. Once it's built and reviewed with the sales rep, it's finalized and sent to the customer.

Today this is a manual process, and mistakes slip through the hand-off — a wrong price, a missed term, a bad date, a margin that isn't what we think it is. By the time a customer catches it, we've lost money or trust. We want to catch these problems before a quote ever leaves Dynamix.

Your task

Build something that verifies a Dynamix customer quote against the source distributor quote it was built from, and tells the user whether it is safe to send to the customer.

What we've provided

Two real (sanitized) documents from a single opportunity:

- The distributor quote (Excel) — the source.
- The Dynamix customer quote (PDF) — built from that source, and the document that would go to the customer.

Customer-identifying details have been removed; every price, SKU, date, and term is genuine and unchanged.

How we're running it

- Approach, tools, and output format are entirely up to you — a script, an agent, a document, a working demo, whatever best represents your solution.
- Treat it as real customer-facing work: accuracy matters, and don't invent data that isn't in the documents.
- Plan for roughly a day of focused effort. We would rather see sharp judgment about what matters than a polished tool aimed at the wrong things.
- Due: [Friday, August 7, 9:00 AM ET]. Send a link to whatever best shows your work — a repository, a document, a short walkthrough video, or a running demo.

- Questions are welcome anytime — reach [Shlomi Abraham / ShlomiAbraham@DynamixGroup.com]. Asking good ones is a plus, not a penalty.

What happens next

After we've reviewed submissions, we'll schedule a short debrief where you'll walk us through what you built, the decisions you made, and where you'd take it next.

We're looking forward to seeing how you approach this.
